

INTRODUCING IOTBRIX

IoTbrix is a cloud-based IoT firmware development environment that allows 'makers' and 'tinkerers' with little programming experience to develop IoT Firmware on a wide number of silicon platforms. These 'makers' and 'tinkerers' can simply drag and drop chips into a project, along with any sensors, actuators and so on. They connect the leads by clicking on the pinouts they want to use and IoTbrix generates the firmware.

This is powerful. It lowers the barrier of entry for everyone, everywhere. Create your IoT dream product. Quickly create prototypes and get them into production. IoTbrix users will always be on the most up-to-date development environment since it is cloud-based. And, being cloud-based, IoTbrix users can begin coding immediately. There is nothing to download or install.

HIGHLIGHTS:

- Drag and drop, no coding required
- Cloud-based, nothing to install, always up-to-date
- Intuitive interface
- Manage project settings
- Ability to view source code
- SoC, sensor, actuator library
